

## In Class Exercise

- **Create two classes Employee and Address as required below.**
  - Address has four fields(data members): street, city, state and zip (all of type String).
  - Employee has five fields: first name(String), last name(String), salary(double), home address and work. address(both of type Address).
  - Place constructors in each class.
  - Place appropriate getters and setters in each class.
  - Write a main method which creates two instances of each class and output some information to the console.
